RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 96 pages. Original publisher: Washington, D. C: National Highway Traffic Safety Administration, 2007. OCLC Number: (OCoLC)235007169 Subject: Alcohol in the body -- Measurement -- Equipment and supplies -- Evaluation. Excerpt: . . . EVALUATING TRANSDERMAL ALCOHOL MEASURING DEVICES ethanol is lost through the skin as vapor through two processes: passive diffusion through the skin and active excretion from the eccrine or sweat glands ( Swift, 2003 ). Because alcohol eventually becomes distributed freely in all body compartments, it can be measured in any body fluid, including compartments as remote as the vitreous in the eyes and cerebrospinal fluid in the brain and as large as the interstitial fluid that bathes cells throughout the body. A device under development by Spectrx, Inc. , samples alcohol in interstitial fluid under the skin by using a laser to shoot miniature holes in the skin and then samples the concentration of alcohol in the fluid of this extra-cellular interstitial compartment. This company has been aided by Small Business Innovative Research ( SBIR ) funds from the National Institutes of Health ( NIH ) and may someday have an alcohol-sensing product ready for commercial application. Spectrxs interest in alcohol as a target substance follows from its primary product development research in glucose monitoring and determination of therapeutic medication levels. All its products are and will be subject to Federal Drug Administration ( FDA ) approval because the laser approach to sampling crosses the dermal barrier. Another company of interest is TruTouch Inc. , staffed by former defense physicists who are skilled in the uses of near-infrared spectroscopy. They have developed a device that can passively evaluate alcohol concentration in the interstitium without breaking the skin surface ( Brown and Ridder, 2005; Ridder, Brown,...
