During the last 30 years, there has been a remarkable development and increase in the number of processes and devices that utilize or emit non-ionizing radiant energies such as micro-waves, a form of electromagnetic wave energy and ultrasound representative of mechanical vibration. These energies are used in all sectors of our society for military, industrial, telecommunications, medical, and consumer applications. More recently, the use of ultrasound in biology and medicine has been considerably expanded. These increases in sources of non-ionizing radiant energy have resulted in growing interest on the part of government regulatory agencies, industrial and military physicians, research workers, clinicians, and even environmentalists. Although there is information on biologic effects and potential hazards to man from exposure to microwaves or ultrasound, considerable confusion and misinformation has permeated not only the public press but also some scientific and technical publications. Interest in the biologic effects of high frequency currents developed in the beginning of the present century. This was followed by the introduction of ultrashortwave therapy. During the latter part of World War II, the U. S. military services became interested in the possible hazards to personnel working around microwave sources, and the Office of Naval Research of the U. S. Navy began to sponsor research on the biologic effects of microwaves in 1948. In 1956, the U. S. Softcover reprint of the original 1st ed. 1975.
