Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Excerpt from Solving Parametric Design Problems: Requiring Configuration Choices Many design tasks involve selection from a set of configurations followed by parametric optimization of the chosen configuration. The models used for these tasks tend to be large, non-linear and involve both discrete and continuous variables. It is rarely possible to use any single formal algorithm to solve these problems and as a result there are very few tools to help designers solve such problems. We believe computer environments that allow flexible access to a varied set of computer tools will help designers rapidly generate high quality solutions. We demonstrate our arguments on a design problem taken from a commercial auto manufacturer, propose a framework for dealing with the general class of problems and describe a preliminary implementation of a novel design system that integrates math programming, knowledge-based and graph theoretic tools. Keywords: Knowledge-based systems, mathematical programming, hybrid systems, graph theory, design. Number of Words (text): 5800, (abstract, appendices etc): 1100 1 Introduction This paper explores decision support tools for engineers who deal with complex input-output models. An input-output model is used to compute a set of performance parameters from a set of input parameters, based on a set of equations (see Figure 1).
